PRODUCT RESPONSE SURFACES

Original GEM Engine GUI exports | Seed 42 | 50,000 landscape conditions per species

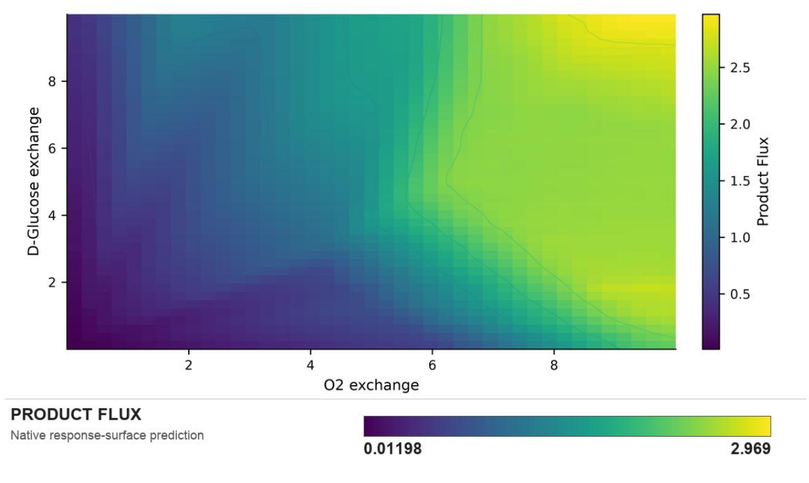

A S. cerevisiae

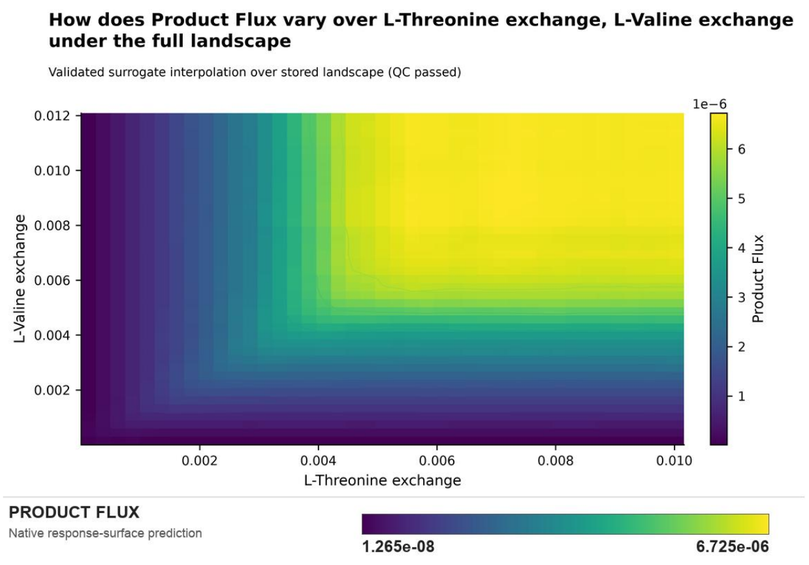

B P. putida

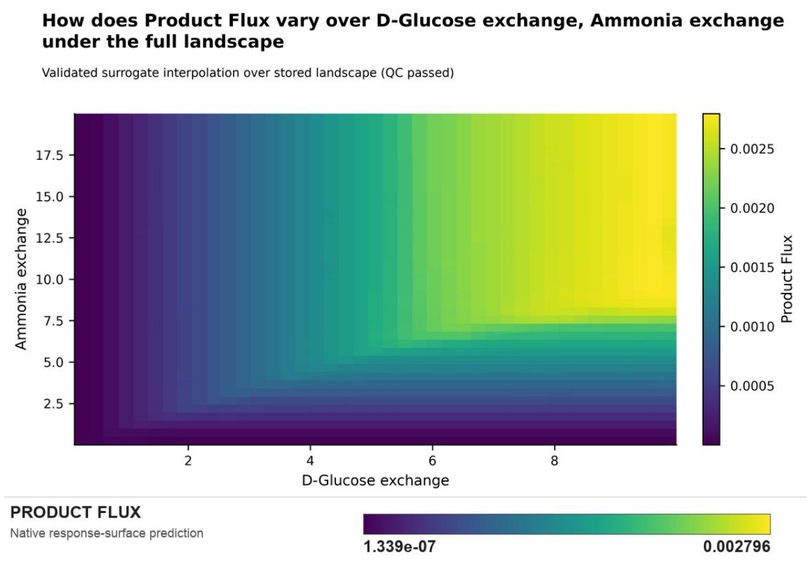

C C. glutamicum

D CHO

E E. coli antiEpEX-scFv

HOW TO READ THESE MAPS

Each surface and its colors come from a native GEM Engine Calculator response-surface export.

The strip beneath each panel gives that species' own product-flux prediction range.

Colors have the same low-to-high direction, but numeric scales differ among species. Do not compare colors between panels as equal flux.

The medium-variable axes are species specific. No new 50K landscape was generated.

Color key: viridis (low product flux -> high product flux). Every panel has an independent numerical range.

Composite is layout/annotation only; numerical response surfaces remain the original native GUI plots.
